

# explain Final Release in details and with substeps

Final Release is the point where you formally approve the product to go to market or full production, with design frozen and all readiness checks complete. It is similar in spirit to a “gold” or production release in software.<sup>[1] [2]</sup>

## 1. Confirm readiness across all domains

- Verify that engineering, testing, manufacturing, quality, service, and commercial teams all declare readiness based on their previous gates (testing validation, manufacturing readiness, etc.).<sup>[2] [3]</sup>
- Check that all defined “release criteria” (e.g., all critical tests passed, open issues below threshold, MRL/TRL targets met) are satisfied or formally waived.<sup>[4] [2]</sup>

## 2. Freeze product definition and configuration

- Lock down the product configuration: final BOM, CAD, drawings, software/firmware versions, materials, and options, so everyone builds the same “released” product.<sup>[5] [2]</sup>
- Establish configuration identifiers (part numbers, revision levels, version tags) and rules for how any future change will be handled via change-control processes.<sup>[3] [6]</sup>

## 3. Verify documentation completeness

- Ensure all technical documentation is complete and consistent: specifications, drawings, work instructions, test procedures, certifications, risk analyses, and user manuals.<sup>[2] [5]</sup>
- Confirm that external documentation (installation guides, service manuals, safety information, labels, regulatory markings) is ready and legally compliant for all target markets.<sup>[3] [4]</sup>

## 4. Review test and validation evidence

- Summarize verification and validation results: lab tests, field trials, reliability testing, compliance/certification reports, and any outstanding deviations.<sup>[5] [2]</sup>
- Check that all critical issues found during testing have been closed or have accepted workarounds, with residual risks documented and approved.<sup>[4] [2]</sup>

## 5. Confirm manufacturing and supply readiness

- Confirm that manufacturing lines, tooling, QA processes, and trained staff can consistently produce the released configuration at the planned volume and quality levels.<sup>[7] [8]</sup>
- Verify that suppliers, logistics, and spare parts provisioning are in place for launch and early ramp-up, including contingency plans for key components.<sup>[9] [10]</sup>

## 6. Align commercial launch and support

- Coordinate with product management, marketing, and sales on launch timing, pricing, packaging, and promotional material that matches the final product capabilities.<sup>[6] [3]</sup>
- Check that service/support structures (helpdesk, field service, spare parts lists, warranty terms) are prepared to handle real customers from day one.<sup>[3] [4]</sup>

## 7. Run a formal Final Release Review

- Hold a structured review/“go-live” or “go/no-go” meeting with decision-makers from all functions; present readiness status, residual risks, and launch plan.<sup>[2] [4]</sup>
- Decide explicitly: Go, Go with conditions (e.g., limited geography/volume, enhanced monitoring), or No-go with required corrective actions and new target date.<sup>[4] [3]</sup>

## 8. Execute release and deployment

- After a Go decision, execute the release: open manufacturing orders, enable ordering in ERP/PLM systems, update catalog data, and trigger logistics and distribution.<sup>[5] [3]</sup>
- For software-containing products, deploy the approved firmware/software images and ensure production/test systems use exactly the released versions.<sup>[1] [4]</sup>

## 9. Monitor early production and field performance

- Track key metrics closely during the initial period: yield, defect rates, returns, customer complaints, and critical incidents.<sup>[6] [3]</sup>
- Maintain a short, fast feedback loop so early issues can be corrected quickly (hotfixes, minor design tweaks, process adjustments) without destabilizing the released baseline.<sup>[11] [5]</sup>

## 10. Archive and baseline for future changes

- Archive all release artefacts (design data, documentation, test evidence, approval records) as the official reference set for this release.<sup>[2] [5]</sup>
- Define how future changes will be handled: minor updates under change control, new revisions, or next-generation projects feeding into your Continuous Improvement stage.

Would you like me to turn these Final Release substeps into a compact checklist you can plug directly into your app's "Final Release" review screen?
